ABSTRACT

Sketches and diagrams play an important role in the daily work of software developers. In this paper, we investigate the use of sketches and diagrams in software engineering practice. To this end, we used both quantitative and qualitative methods. We present the results of an exploratory study in three companies and an online survey with 394 participants. Our participants included software developers, software architects, project managers, consultants, as well as researchers. They worked in different countries and on projects from a wide range of application areas. Most questions in the survey were related to the last sketch or diagram that the participants had created. Contrary to our expectations and previous work, the majority of sketches and

1. INTRODUCTION

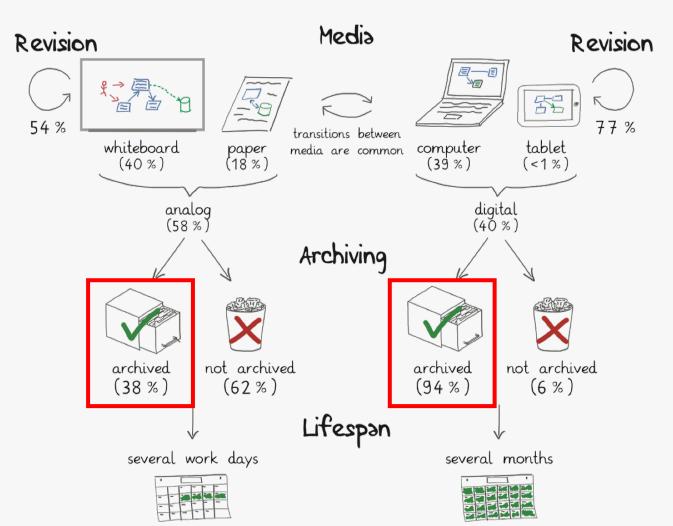

Over the past years, studies have shown the importance of sketches and diagrams in software development [6,11,43]. Most of these visual artifacts do not follow formal conventions like the *Unified Modeling Language* (UML), but have an informal, ad-hoc nature [6,11,23,25]. Sketches and diagrams are important because they depict parts of the mental model developers build to understand a software project [21]. They may contain different views, levels of abstraction, formal and informal notations, pictures, or generated parts [6, 11,41,42]. Developers create sketches and diagrams mainly to understand, to design, and to communicate [6]. Media for sketch creation include whiteboards, engineering notebooks, scrap papers, but also software tools like Photoshop

Expertise Development

Towards a Theory of Software Development Expertise

Sebastian Baltes University of Trier Trier, Germany research@sbaltes.com

Stephan Diehl University of Trier Trier, Germany diehl@uni-trier.de

ABSTRACT

Software development includes diverse tasks such as implementing new features, analyzing requirements, and fixing bugs. Being an expert in those tasks requires a certain set of skills, knowledge, and experience. Several studies investigated individual aspects of software development expertise, but what is missing is a comprehensive theory. We present a first conceptual theory of software development expertise that is grounded in data from a mixed-methods survey with 335 software developers and in literature on expertise and expert performance. Our theory currently focuses on programming, but already provides valuable insights for researchers, developers, and employers. The theory describes important properties of software development expertise and which factors foster or hinder its formation, including how developers' performance may decline over time. Moreover, our quantitative results show that developers' expertise self-assessments are context-dependent and that experience is not necessarily related to expertise.

expert performance [78]. Bergersen et al. proposed an instrument to measure programming skill [9], but their approach may suffer from learning effects because it is based on a fixed set of programming tasks. Furthermore, aside from programming, software development involves many other tasks such as requirements engineering, testing, and debugging [62, 96, 100], in which a software development expert is expected to be good at.

In the past, researchers investigated certain aspects of software development expertise (SDExp) such as the influence of programming experience [95], desired attributes of software engineers [63], or the time it takes for developers to become "fluent" in software projects [117]. However, there is currently no theory combining those individual aspects. Such a theory could help structuring existing knowledge about SDExp in a concise and precise way and hence facilitate its communication [44]. Despite many arguments in favor of developing and using theories [46, 56, 85, 109], theory-driven research is not very common in software engineering [97].

Software Development Expertise?

Research Questions

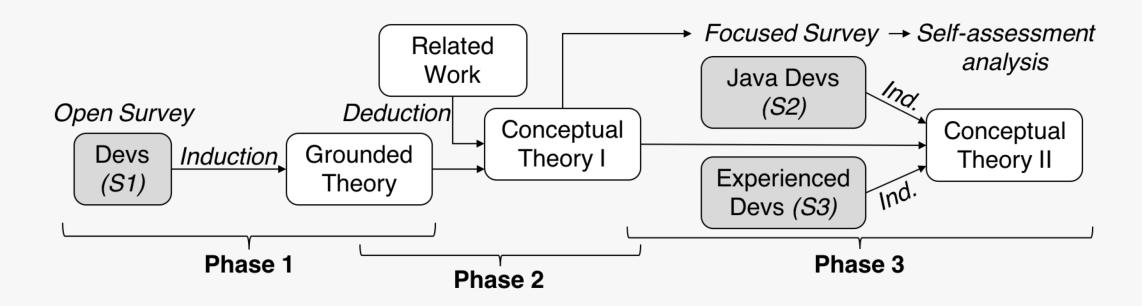

Questions:

How to **structure** all those expertise-related aspects? Which factors influence **expertise development** over time?

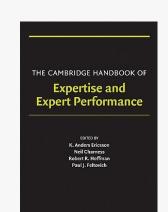

Approach:

Iterative theory building

Research Design

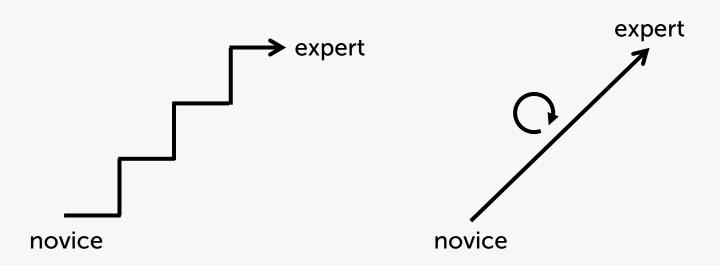

- Induction: 335 online survey participants in total
- **Deduction:** Main source "Cambridge Handbook of Expertise and Expert Performance"

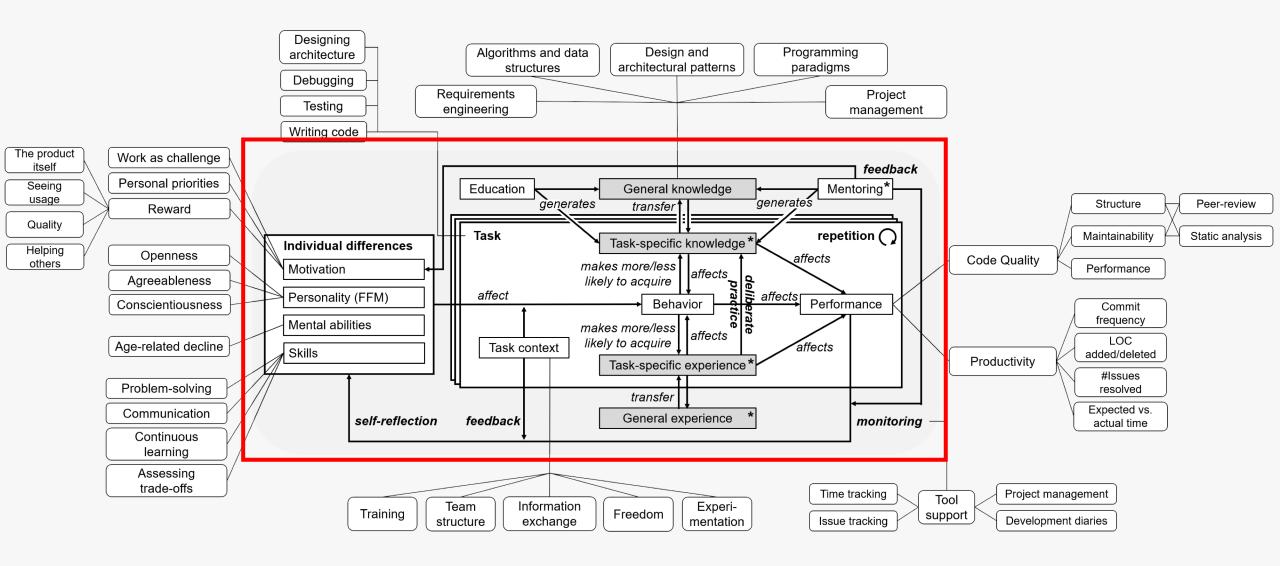

Our Expertise Model

- Task-specific (e.g., writing code, debugging, testing)
- Focuses on individual developers
- Process view (repetition of tasks)
- Notion of transferable knowledge and experience from related fields or tasks
- Continuum instead of discrete expertise steps

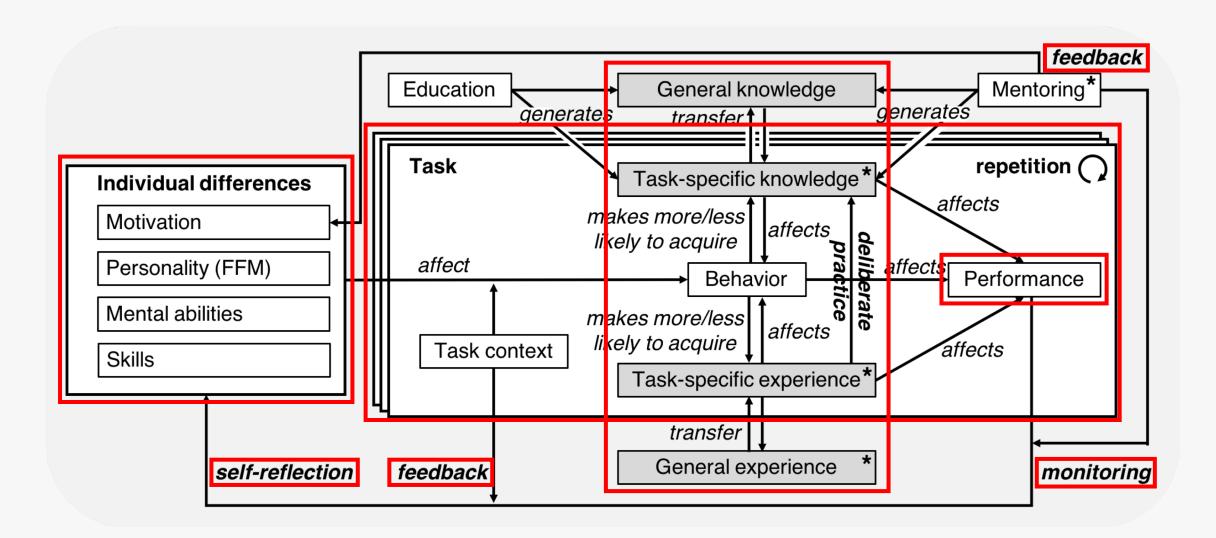

Conceptual Theory

Conceptual Theory

Age-Related Performance Decline

"For myself, it's mostly the effects of aging on the brain. At age 66, I can't hold as much information in short-term memory, for example. [...] I can compensate for a lot of that by writing simpler functions with clean interfaces. The results are still good, but my productivity is much slower than when I was younger."

"Programming ability is based on desire to achieve. In the early years, it is a sort of competition.
[...] I found that I lost a significant amount of my focus as I became 40, and started using drugs such as ritalin to enhance my abilities. This is pretty common among older programmers."

software architect, age 66

software developer, age 60

Summary

Researchers can...

- Use our theory to design studies on expertise development
- Adopt our theory building approach

Developers can...

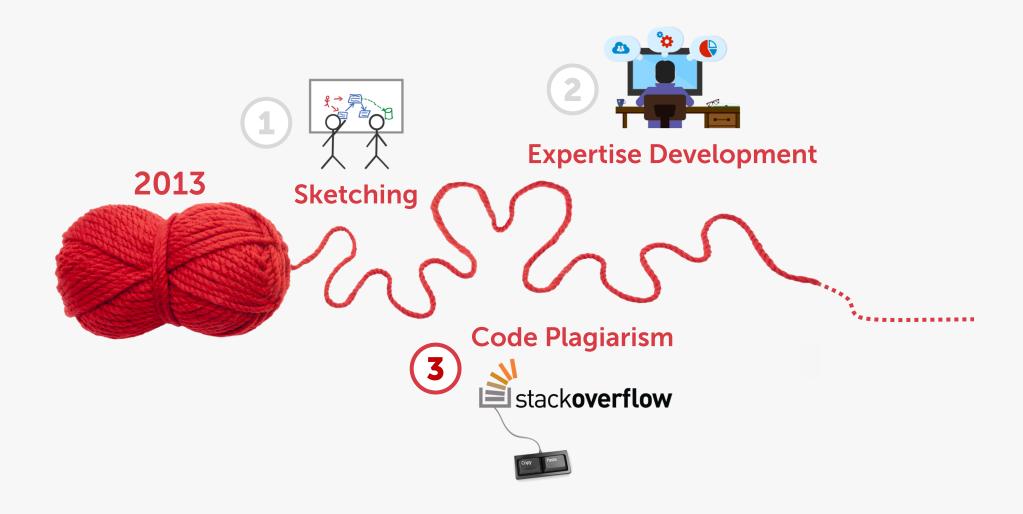

- Learn what other developers expect from experts/mentors
- · Learn which behaviors may lead to becoming an expert

Employers can...

- Learn what (de)motivates employees and thus fosters or hinders expertise development
- Reflect on ideas to build a work environment supporting self-improvement of their staff

Abstract

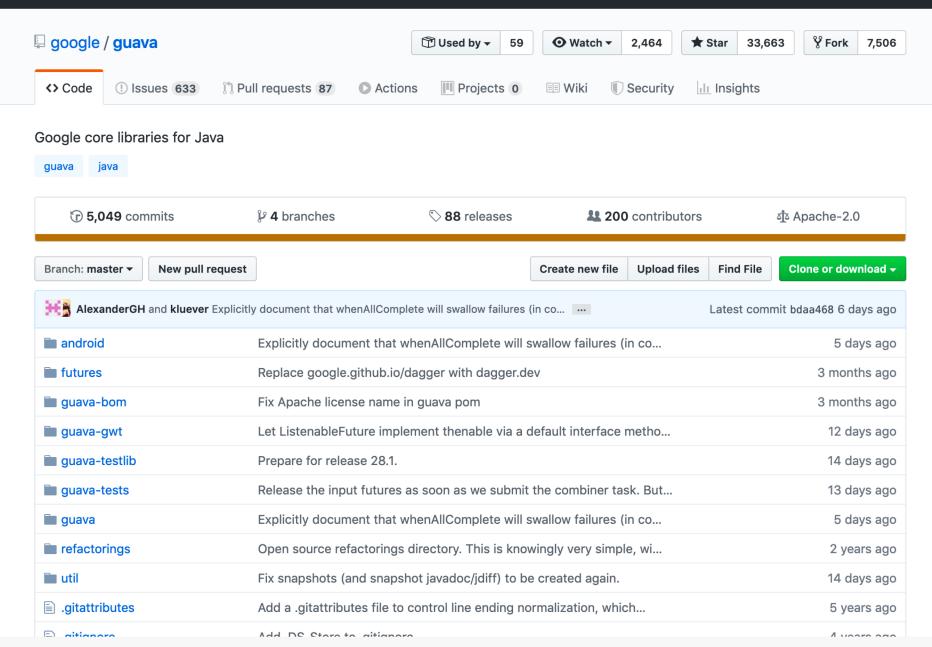

Stack Overflow (SO) is the most popular question-and-answer website for software developers, providing a large amount of copyable code snippets. Using those snippets raises maintenance and legal issues. SO's license (CC BY-SA 3.0) requires attribution, i.e., referencing the original question or answer, and requires derived work to adopt a compatible license. While there is a heated debate on SO's license model for code snippets and the

How do I read / convert an InputStream into a String in Java?

Asked 10 years, 9 months ago Active 2 days ago Viewed 2.0m times

If you have a java.io. InputStream object, how should you process that object and produce a String?

3775

Suppose I have an InputStream that contains text data, and I want to convert it to a String, so for example I can write that to a log file.

* 1107

What's this?

What is the easiest way to take the InputStream and convert it to a String?

```
public String convertStreamToString(InputStream is) {
   // ???
```

string

stream

inputstream

Johnny Maelstrom 19.3k • 5 • 17 • 17

- Boy, I'm absolutely in love with Java, but this question comes up so often you'd think they'd just figure out that the chaining of streams is somewhat difficult and either make helpers to create various combinations or rethink the whole thing. - Bill K Nov 21 '08 at 17:16
- The answers to this question only work if you want to read the stream's contents fully (until it is closed). Since that is not always intended (http requests with a keep-alive connection won't be closed), these method calls block (not giving you the contents). – f1sh Jul 14 '10 at 13:32

Here's a way using only the standard Java library (note that the stream is not closed, your mileage may vary).

```
static String convertStreamToString(java.io.InputStream is) {
    java.util.Scanner s = new java.util.Scanner(is).useDelimiter("\\A");
    return s.hasNext() ? s.next() : "";
```

I learned this trick from "Stupid Scanner tricks" article. The reason it works is because Scanner iterates over tokens in the stream, and in this case we separate tokens using "beginning of the input boundary" (A), thus giving us only one token for the entire contents of the stream.

Note, if you need to be specific about the input stream's encoding, you can provide the second argument to Scanner constructor that indicates what character set to use (e.g. "UTF-8").

Hat tip goes also to Jacob, who once pointed me to the said article.

Thanks, for my version of this I added a finally block that closes the input stream, so the user doesn't have to since you've finished reading the input. Simplifies the caller code considerably. - user486646 Apr 21 '12 at 17:07

answered Mar 26 '11 at 20:40

- 7 Thanks, for my version of this I added a finally block that closes the input stream, so the user doesn't have to since you've finished reading the input. Simplifies the caller code considerably. user486646 Apr 21 '12 at 17:07 *
- 4 @PavelRepin @Patrick in my case, an empty inputStream caused a NPE during Scanner construction. I had to add if (is == null) return ""; right at the beginning of the method; I believe this answer needs to be updated to better handle null inputStreams. CFL Jeff Aug 9 '12 at 13:36 *

The problem with this approach I find is it does not handle CR/LF translations too well. So you have to make sure your line endings are consistent. – Archimedes Traiano Feb 28 '13 at 12:13

@ArchimedesTrajano does IOUtils.copy(inputStream, writer, encoding) deal with CR/LF translations better? I think CR/LF consistency is entirely unrelated issue. Not saying it isn't an issue.

- Pavel Repin Mar 1 '13 at 9:18

- 95 For Java 7 you can close in a try-with: try(java.util.Scanner s = new java.util.Scanner(is)) { return s.useDelimiter("\\A").hasNext() ? s.next() : ""; } earcam Jun 13 '13 at 5:24 *
- 3 Unfortunately this solution seems to go and lose the exceptions thrown in my underlying stream implementation. Taig Jul 16 '13 at 7:59

excellent trick! any ideas about performance of Scanner vs reading the stream in a more verbose way?

— isapir Aug 28 '13 at 19:54

@lgal I didn't measure it. If you do, gist it and I'll append your results to the answer. – Pavel Repin Aug 28 '13 at 23:13

- FYI, hasNext blocks on console input streams (see here). (Just ran into this issue right now.) This solution works fine otherwise... just a heads up. Ryan Feb 24 14 at 5:36
- 1 @earcam thanks for the tip! For those wondering how this works, it's thanks to try-with-resources Mark Mar 14 '15 at 21:33
- 1 looks like a neat trick, but it seems there are some limitations. For me it hangs when reading InputStream from Socket. When testing with something like ByteArrayInputStream it works nicely. Reading from socket results in a hang. – Normunds Kalnberzins Dec 16 '15 at 14:16

If the Scanner is going to be "giving us only one token for the entire contents of the stream" anyways, why not use a normal stream reader? Scanner is meant to pre-parse tokens out of the stream, not for being the stream reader (without any parsing being done). – XenoRo Dec 28 '15 at 14:06

@AlmightyR Scanner has built-in stream reading logic and we're telling it that the stream has just one token. A special case of Scanner usage. Fair game. Good point though. This stuff is clearly a hack.

— Pavel Repin Jan 15 '16 at 1:23

- be careful ,using this method with socket stream is slow! Scanner#next() hangs for a little while.
 WestFarmer Apr 20 '16 at 10:22

Stack Overflow's License

"You must give appropriate credit [...] and indicate if changes were made."

"If you [...] build upon the material, you must distribute your contributions under the same license as the original."

Results from our Online Surveys

- 46% of the participants admitted copying code from Stack Overflow without attribution
- 75% did not know that content on SO is licensed under CC BY-SA
- 67% did not know that attribution is required

→ Lack of awareness

Background

"Well, but these snippets are rather trivial and not protected by copyright."

- Not all code snippets on Stack Overflow are copyrightable
- "A snippet that is more than one or two lines of standard function calls would typically be creative enough for copyright" [Engelfriet 2016]
- But no "international standard for originality" [Creative Commons 2017b]

Here's what I do:

88

- 89
- First of all I check what providers are enabled. Some may be disabled on the device, some may be disabled in application manifest.
- If any provider is available I start location listeners and timeout timer. It's 20 seconds in my example, may not be enough for GPS so you can enlarge it.
- 3. If I get update from location listener I use the provided value. I stop listeners and timer.
- 4. If I don't get any updates and timer elapses I have to use last known values
- 5. I grab last known values from available providers and choose the most recent of them.

Here's how I use my class:

```
LocationResult locationResult = new LocationResult(){
    @Override
    public void gotLocation(Location location){
        //Got the location!
    };
};
MyLocation myLocation = new MyLocation();
myLocation.getLocation(this, locationResult);
```

And here's MyLocation class:

```
import java.util.Timer;
import java.util.TimerTask;
import android.content.Context;
import android.location.Location;
import android.location.LocationListener;
import android.location.LocationManager;
import android.os.Bundle;
public class MyLocation {
   Timer timer1:
   LocationManager lm;
   LocationResult locationResult;
   boolean gps enabled=false;
   boolean network_enabled=false;
   public boolean getLocation(Context context, LocationResult result)
        //I use LocationResult callback class to pass location value from MyLocat
        locationResult=result:
           lm = (LocationManager) context.getSystemService(Context.LOCATION_SERV.
       //exceptions will be thrown if provider is not permitted.
       try(gps enabled=lm.isProviderEnabled(LocationManager.GPS PROVIDER):}catch
       try{network enabled=lm.isProviderEnabled(LocationManager.NETWORK PROVIDER
        //don't start listeners if no provider is enabled
       if(!gps_enabled && !network_enabled)
            return false;
            lm.requestLocationUpdates(LocationManager.GPS_PROVIDER, 0, 0, location
        if(network enabled)
           lm.requestLocationUpdates(LocationManager.NETWORK PROVIDER, 0, 0, loc ✓
```

Somebody may also want to modify my logic. For example if you get update from Network provider don't stop listeners but continue waiting. GPS gives more accurate data so it's worth waiting for it. If timer elapses and you've got update from Network but not from GPS then you can use value provided from Network.

One more approach is to use LocationClient http://developer.android.com/training/location/retrieve-current.html. But it requires Google Play Services apk to be installed on user device.

Stack Overflow Code in the OpenJDK

implement the method humanReadableByteCount which body was copied from the Stack Overflow site: https://stackoverflow.com/a/3758880

It's just a few lines of code, but it could cause legal issues. The method should be either re-implemented or removed.

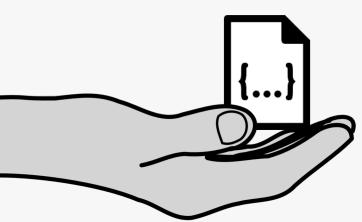

Besides the potential legal issues, duplicating a code is not a good practice.

https://bugs.openjdk.java.net/browse/JDK-8170860

Implications of Stack Overflow's License

Permissive Licenses

- Permit using the licensed source code in proprietary software without publishing changes or the derived work
- Examples: MIT, Apache, and BSD license families

Copyleft Licenses

- Requires either modifications to the licensed content or the complete derived work to be published under the same or a compatible license (share-alike)
- Examples (weak copyleft):
 Mozilla/Eclipse Public Licenses
- Examples (viral copyleft): GNU
 General Public Licenses, Creative
 Commons Share-Alike Licenses
 (e.g., CC BY-SA)

Enforceability of Copyleft Licenses

- Courts in the US and Europe ruled that open source licenses are enforceable contracts
- Authors are able to sue when terms such as the share-alike requirement are violated:
 - Interdict distribution of derived work
 - Claim monetary damages
- USA: DMCA takedown notices for allegedly infringed copyright
 - Example: https://github.com/github/dmca
- Risk in mergers and acquisitions of companies
 - Example: FSF vs. Cisco lawsuit

Code Plagiarism

Research Question

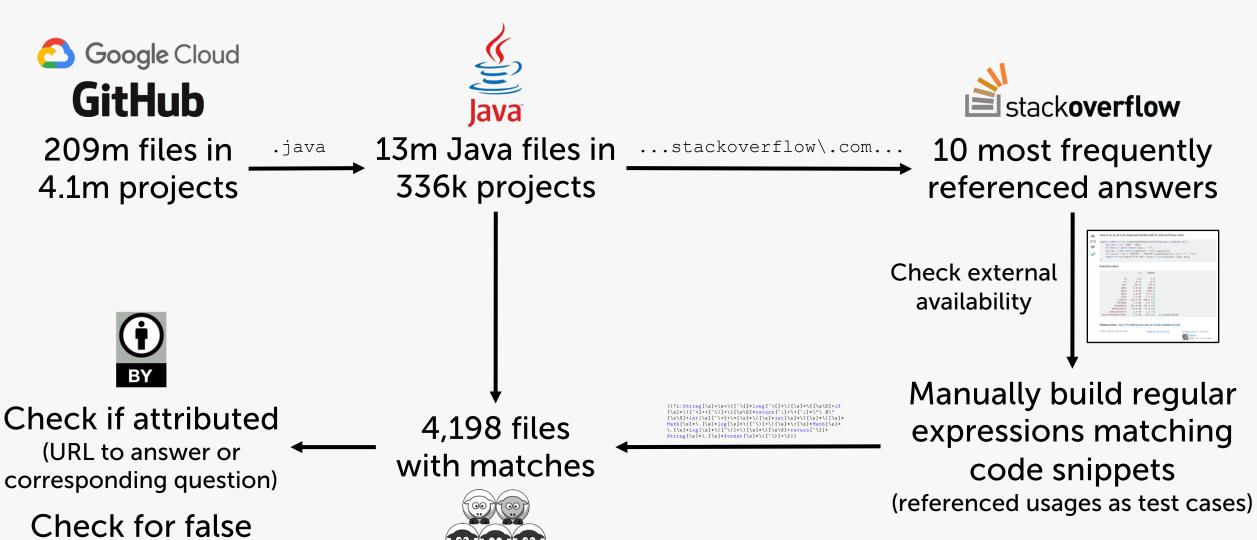

Question:

How **frequently** is code from Stack Overflow posts used in public GitHub projects without the required attribution?

Approach:

Triangulate an estimate for the attribution ratio using three different methods.

Method 1: Regular Expressions

positives

Exemplary Regex

```
public static String humanReadableByteCount(long bytes, boolean si) {
   int unit = si ? 1000 : 1024;
   if (bytes < unit) return bytes + " B";
   int exp = (int) (Math.log(bytes) / Math.log(unit));
   String pre = (si ? "kMGTPE" : "KMGTPE").charAt(exp-1) + (si ? "" : "i");
   return String.format("%.1f %sB", bytes / Math.pow(unit, exp), pre);
}</pre>
```

```
((?i:String[\s]+\w+\([^\{]*long[^\{]+\)[\s]*\{[\s\S]+if[\s]*\([^<]+<[^\)]+\)

All	10,931	4,198	402	3,796	M 61.9%	M 12.1%	M 23.2%

Method 2: Code Clone Detector

- Goal: Use code clone detector to find clones of a sample of Stack Overflow snippets in a sample of GitHub projects
- Why samples?
 - Code clone detection is computationally expensive

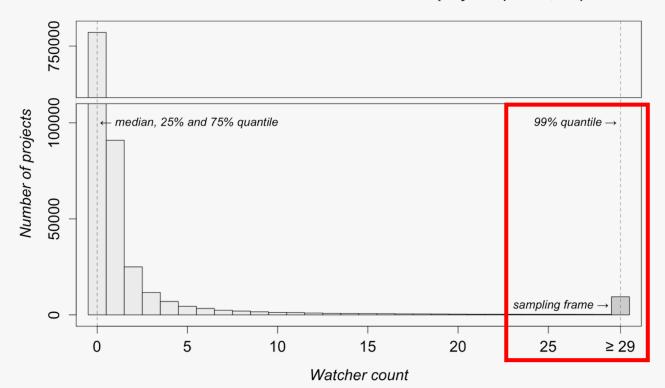

- Which snippets and projects to select?
 - Random samples: Many toy projects on GitHub and many irrelevant snippets on Stack Overflow
 - Purposive sampling: Limited generalizability

GitHub Project Sample

- Focus on popular GitHub projects
- High precision in selecting "engineered" software projects [Munaiah et al. 2017]
- Greater (potential) impact of licensing issues

Watcher count filter for non-fork Java GH projects (n=925,536)

Sample size: 3,000 / 2,313

Stack Overflow Snippet Samples

 Non-trivial snippets retrieved from 100 most frequently referenced answers (n=111)

$$\Rightarrow S_{\text{top100}}$$

 Non-trivial snippets retrieved from answers referenced in GitHub projects (n=137)

$$\Rightarrow S_{\rm gh}$$

 External sources: Only three snippets available under a more permissive license than CC BY-SA

stackoverflow

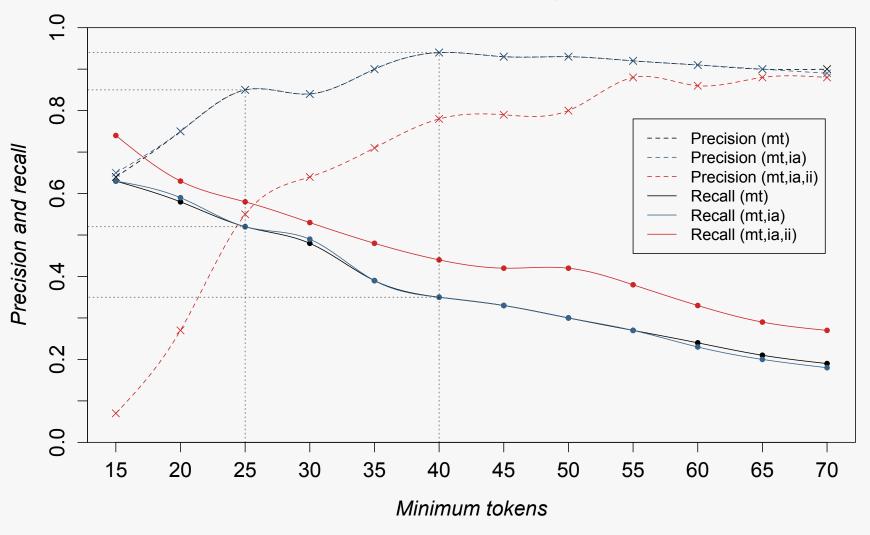

Code Clone Detector Calibration

DON'T SHOOT THE MESSENGER

Comparison of CPD configurations

Results

Set	Snippets				Files		Repos
	ALL	MATCHED	ANSWERS	MATCHED	MATCH.	REF	MATCHED
$S_{ m gh} \ S_{ m top 100}$	137	53 (39%)	102	52 (51%)	163	58 (36%)	124 (5%)
S_{top100}	111	48 (43%)	85	46 (54%)	173	25 (14%)	125 (5%)
$\cup S$	222	101 (46%)	169	86 (51%)	297	70 (24%)	199 (9%)

Method 3: Exact Matches

- Goal: Address shortcomings of Method 1 and 2
 - Increase sample sizes
 - Exclude snippets available on external sources
 - Systematically exclude short snippets
- Select as many projects and snippets as possible and search for (almost) exact matches

Method 3: Exact Matches

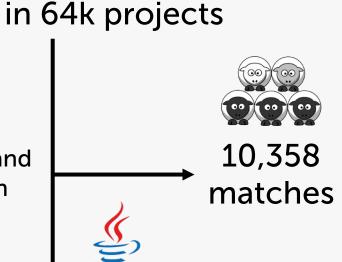

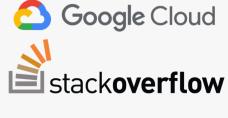

- ✓ Project is not a fork, has ≥ 5 Java files and ≥ 1 watcher(s)
- √ File has ending .java has ≥ 68 NLOC (Q₃)

Java 1.7m Java files

Normalization and substring search

21m answers

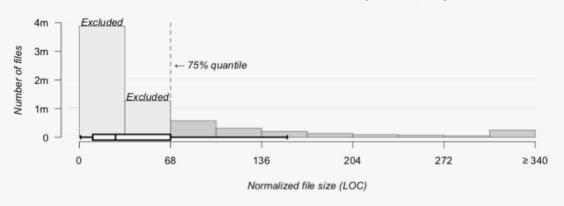

- ✓ Question tagged java or android
- ✓ Answer score \geq 10
- ✓ Code block ≥ 6 NLOC

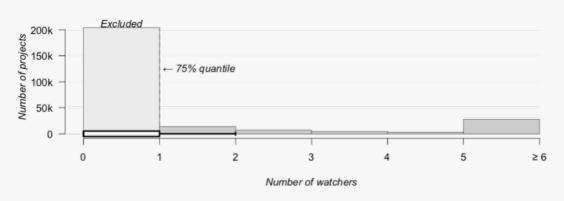

29k snippets from 24k answers

Proxies for originality

Method 3: Filtering of Matches

✓ Use heuristic to detect and exclude matches in mirrors of JDK and Android source code

Only 7.6% attributed (URL to answer or corresponding question)

- ✓ Manually analyze answers, exclude snippets that are too trivial, incomplete, or copied from an external source
- ✓ Use **GitHub** API to remove matches where commit adding snippet is older than answer on Stack Overflow

Attribution

Attribution ratio:

- Method 1 (regular expressions): 23 %
- Method 2 (code clone detector): 24 %
- Method 3 (exact matches): 8 %

Conservative estimate:

Attribution ratio ≤ 25%

Share-alike

Only **2%** of all analyzed repositories (all methods) containing code from Stack Overflow **attributed** its source and used a **compatible license** (not CC BY-SA, but GPL 3.0).

SPDX license name	Number of repos containing a Sunattributed $(n = 2, 962)$	SO code snippet clone that was: attributed $(n = 329)$
Apache-2.0	921 (31.1%)	99 (30.1%)

Abstract—Stack Overflow (SO) is the most popular questionand-answer website for software developers, providing a large amount of copyable code snippets. Like other software artifacts, code on SO evolves over time, for example when bugs are fixed or APIs are updated to the most recent version. To be able to analyze how code and the surrounding text on SO evolves, we built SOTorrent, an open dataset based on the official SO data dump. SOTorrent provides access to the version history of SO content at the level of whole posts and individual text and code blocks. It connects code snippets from SO posts to other platforms by aggregating URLs from surrounding text blocks and comments, and by collecting references from GitHub files to SO posts. Our vision is that researchers will use SOTorrent to investigate and understand the evolution and maintenance of code on SO and its relation to other platforms such as GitHub.

dataset [16] that enables researchers to analyze the version history of SO posts at the level of individual text and code blocks (see Figure 1] for exemplary posts). The official SO data dump [1] keeps track of different versions of entire posts, but does not contain information about differences between versions at a more fine-grained level. In particular, extracting different versions of the same code snippet from the history of a post is challenging and required us to develop a complex strategy, involving the evaluation of 134 different string similarity metrics [15]. Beside providing access to the version history, our dataset links SO posts to external resources in two ways: (1) by extracting linked URLs from text blocks of SO posts and from post comments and (2) by providing
